Intervi<sup>u</sup> site is an isolated area with hills & mountains. Ground is barren - little vegetation. Climate is warm & dry. From above, there is perceived a network of roads with clusters of flat-roofed buildings. The terrain has several black spots. There appears to be a possibility of 3 type of man-made structures at the site. One produces a feeling of swift motion, another a twinkling sound. The buildings appear to be marked in some way (Ave - numbers & letters).

- This is a short fuse project, everyone else has or will run this problem to the exclusion of others -
- GRIM/TASTE/TUMBLING sounds seem a little early  
(Yes - They should be labelled S4)
- You seem to be pulling in sensory data early on -  
(Yes - its ok in S2 - TASTE, feel, etc)
- You did not not objectify (state) your AI -  
(I know - it was a feeling of two movements either direction)
- You listed a group of sol's - (Yes) were these PI - (maybe, I don't know - I seem to be ratcheting).
- Review your data thus far and see if it doesn't help your signal line (OK) -
- How do you feel about it thus far - do you think there is more to be gained - (No) - would you like to move on (Yes I'm going to try Stage IV).

3

- What column are you writing those descriptions of your drawing - (not under any column really - I guess then under the "3" -
- What did you just write (ground level)
- You're running around. Write an column summary before you move on to objectify the ~~the~~ items you have thus far
- You labeled the buildings according to their functions begin with #1 -
- You mentioned compact & portable in conjunction with the building - is it the building - ? (I don't know maybe its something in the building) -
- Let's try the second building - a feeling of very fast movement (OK)
- (I am having trouble staying on signal) Re-read your summary.
- "Time line" (OK)
- more instructive - Touch the point - stay in
